

CASE STUDY - INTERVENTION MAPPING AND GENDER CONTINUUM ASSESSMENT

The "Wasala Pathway" intervention targets married adolescent girls in Northern Nigeria's rural communities, combining multiple approaches to sexual and reproductive health. At its core, the program includes: a mobile clinic service offering contraceptive and reproductive health screenings; community workshops led by local religious leaders promoting family planning; a skills training component where girls learn income-generating activities like tailoring; and a "bride performance" tracking system where husbands receive community recognition points based on their wife's health compliance and participation in family planning activities. The intervention aims to increase girls' access to reproductive health services while navigating the complex social dynamics of the region, with the explicit goal of reducing maternal mortality and different stakeholders - from the girls themselves to their husbands, family members, and community leaders - creating a multi-layered approach to reproductive health education and service delivery.

PART 1

1. In your group, break up the intervention described above into its components
2. Rate each component against the gender equality continuum, using the Gender Continuum handout. You can use the table below to capture your thinking. We will come back to plenary to discuss your ratings before continuing to Part 2.

Intervention Component	Gender Equality Continuum Ranking	Justification

--	--	--

PART 2

1. Brainstorm ways you could move components towards being more gender sensitive or transformative, as applicable. Focus on any gender negative components first and ensure they are moved towards gender neutral, at the very least.

Intervention Component	Suggested Improvements	New Gender Equality Continuum Ranking
